## Higher-Order Tensors

Many real-world data are higher-order tensors: e.g., color video, hyperspectral image, and traffic data.

color video

hyperspectral image

traffic data

## Tensor Completion

Missing Values Problems: recommender system design, image/video inpainting, and traffic data completion.

recommender system

hyperspectral image

traffic data

## Tensor Completion

Missing Values Problems: recommender system design, image/video inpainting, and traffic data completion.

recommender system

hyperspectral image

traffic data

Tensor Completion (TC): complete a tensor from its partial observation.

## III-Posed Inverse Problem

III-posed inverse problem

## III-Posed Inverse Problem

III-posed inverse problem
$\Uparrow$
Prior/Intrinsic property

- Piecewise smoothness
- Nonlocal self-similarity
- Low-rankness

## III-Posed Inverse Problem

Low-Rank Tensor Decomposition ( $\Phi$ )

Prior/Intrinsic property

- Piecewise smoothness
- Nonlocal self-similarity
- Low-rankness

$$
\begin{aligned}
\min _{\mathcal{X}, \mathcal{G}} & \frac{1}{2}\left\|\mathcal{X}-\Phi\left(\mathcal{G}_{1}, \mathcal{G}_{2}, \cdots, \mathcal{G}_{N}\right)\right\|_{F}^{2}, \\
\text { s.t. } & \mathcal{P}_{\Omega}(\mathcal{X})=\mathcal{P}_{\Omega}(\mathcal{F}) .
\end{aligned}
$$

Minimizing Tensor Rank

$$
\begin{aligned}
\min _{\mathcal{X}} & \operatorname{Rank}(\mathcal{X}), \\
\text { s.t. } & \mathcal{P}_{\Omega}(\mathcal{X})=\mathcal{P}_{\Omega}(\mathcal{F}) .
\end{aligned}
$$

Here $\mathcal{F} \in \mathbb{R}^{I_{1} \times I_{2} \times \cdots \times I_{N}}$ is an incomplete observation of $\mathcal{X} \in \mathbb{R}^{I_{1} \times I_{2} \times \cdots \times I_{N}}, \Omega$ is the index of the known elements, and $\mathcal{P}_{\Omega}(\mathcal{X})$ is a projection operator which projects the elements in $\Omega$ to themselves and all others to zeros.

## Tensor Decomposition

## Tensor Decomposition

- decomposes a higher-order tensor to a set of low-dimensional factors;
- has powerful capability to capture the global correlations of tensors.

## Tensor Decomposition

## Tensor Decomposition

- decomposes a higher-order tensor to a set of low-dimensional factors;
- has powerful capability to capture the global correlations of tensors.

Tucker decomposition

CANDECOMP/PARAFAC (CP) decomposition

## Tensor Decomposition

## Limitations of Tucker Decomposition

- only characterizes correlations among one mode and all the rest of modes, rather than between any two modes;
- needs high storage cost.

## Tensor Decomposition

## Limitations of Tucker Decomposition

- only characterizes correlations among one mode and all the rest of modes, rather than between any two modes;
- needs high storage cost.

## Limitations of CP Decomposition

- difficulty in flexibly characterizing different correlations among different modes;
- difficulty in finding the optimal solution.

## Tensor Decompositions

Recently, the popular tensor train (TT) and tensor ring (TR) decompositions have emerged and shown great ability to deal with higher-order, especially beyond thirdorder tensors.

Recently, the popular tensor train (TT) and tensor ring (TR) decompositions have emerged and shown great ability to deal with higher-order, especially beyond thirdorder tensors.

TT decomposition

## Tensor Decompositions

Recently, the popular tensor train (TT) and tensor ring (TR) decompositions have emerged and shown great ability to deal with higher-order, especially beyond thirdorder tensors.

TT decomposition

$$
\begin{aligned}
& \mathcal{X}\left(i_{1}, i_{2}, \cdots, i_{N}\right)=\sum_{r_{1}=1}^{R_{1}} \sum_{r_{2}=1}^{R_{2}} \cdots \sum_{r_{N}=1}^{R_{N}} \\
& \left\{\mathcal{G}_{1}\left(r_{N}, i_{1}, r_{1}\right) \mathcal{G}_{2}\left(r_{1}, i_{2}, r_{2}\right) \cdots \mathcal{G}_{N}\left(r_{N-1}, i_{N}, r_{N}\right)\right\}
\end{aligned}
$$

TR decomposition

## Motivations

Limitations of TT and TR Decomposition

- A limited correlation characterization: only establish a connection (operation) between adjacent two factors, rather than any two factors;

## Motivations

## Limitations of TT and TR Decomposition

- A limited correlation characterization: only establish a connection (operation) between adjacent two factors, rather than any two factors;
- Without transpositional invariance: keep the invariance only when the tensor modes make a reverse permuting (TT and TR) or a circular shifting (only TR), rather than any permuting.

Examples:
$\triangleright$ reverse permuting: $[1,2,3,4] \rightarrow[4,3,2,1]$;
$\triangleright$ circular shifting: $[1,2,3,4] \rightarrow[2,3,4,1],[3,4,1,2],[4,1,2,3]$.

## FCTN Decomposition

## Definition 1 (FCTN Decomposition)

The FCTN decomposition aims to decompose an Nth-order tensor $\mathcal{X}$ into a set of lowdimensional Nth-order factor tensors $\mathcal{G}_{k}(k=1,2, \cdots, N)$. The element-wise form of the FCTN decomposition can be expressed as

$$
\begin{align*}
\mathcal{X}\left(i_{1}, i_{2}, \cdots, i_{N}\right)= & \sum_{r_{1,2}=1}^{R_{1,2}} \sum_{r_{1,3}=1}^{R_{1,3}} \cdots \sum_{r_{1, N}=1}^{R_{1, N}} \sum_{r_{2,3}=1}^{R_{2,3}} \cdots \sum_{r_{2, N}=1}^{R_{2, N}} \cdots \sum_{r_{N-1, N}=1}^{R_{N-1, N}} \\
& \left\{\mathcal{G}_{1}\left(i_{1}, r_{1,2}, r_{1,3}, \cdots, r_{1, N}\right)\right.  \tag{1}\\
& \mathcal{G}_{2}\left(r_{1,2}, i_{2}, r_{2,3}, \cdots, r_{2, N}\right) \cdots \\
& \mathcal{G}_{k}\left(r_{1, k}, r_{2, k}, \cdots, r_{k-1, k}, i_{k}, r_{k, k+1}, \cdots, r_{k, N}\right) \cdots \\
& \left.\mathcal{G}_{N}\left(r_{1, N}, r_{2, N}, \cdots, r_{N-1, N}, i_{N}\right)\right\} .
\end{align*}
$$

Note: Here $\mathcal{X} \in \mathbb{R}^{I_{1} \times I_{2} \times \cdots \times I_{N}}$ and $\mathcal{G}_{k} \in \mathbb{R}^{R_{1, k} \times R_{2, k} \times \cdots \times R_{k-1, k} \times I_{k} \times R_{k, k+1} \times \cdots \times R_{k, N}}$.

## FCTN Decomposition

## Definition 1 (FCTN Decomposition)

The FCTN decomposition aims to decompose an Nth-order tensor $\mathcal{X}$ into a set of lowdimensional Nth-order factor tensors $\mathcal{G}_{k}(k=1,2, \cdots, N)$. The element-wise form of the FCTN decomposition can be expressed as

$$
\begin{align*}
\mathcal{X}\left(i_{1}, i_{2}, \cdots, i_{N}\right)= & \sum_{r_{1,2}=1}^{R_{1,2}} \sum_{r_{1,3}=1}^{R_{1,3}} \cdots \sum_{r_{1, N}=1}^{R_{1, N}} \sum_{r_{2,3}=1}^{R_{2,3}} \cdots \sum_{r_{2, N}=1}^{R_{2, N}} \cdots \sum_{r_{N-1, N}=1}^{R_{N-1, N}} \\
& \left\{\mathcal{G}_{1}\left(i_{1}, r_{1,2}, r_{1,3}, \cdots, r_{1, N}\right)\right.  \tag{1}\\
& \mathcal{G}_{2}\left(r_{1,2}, i_{2}, r_{2,3}, \cdots, r_{2, N}\right) \cdots \\
& \mathcal{G}_{k}\left(r_{1, k}, r_{2, k}, \cdots, r_{k-1, k}, i_{k}, r_{k, k+1}, \cdots, r_{k, N}\right) \cdots \\
& \left.\mathcal{G}_{N}\left(r_{1, N}, r_{2, N}, \cdots, r_{N-1, N}, i_{N}\right)\right\} .
\end{align*}
$$

Note: Here $\mathcal{X} \in \mathbb{R}^{I_{1} \times I_{2} \times \cdots \times I_{N}}$ and $\mathcal{G}_{k} \in \mathbb{R}^{R_{1, k} \times R_{2, k} \times \cdots \times R_{k-1, k} \times I_{k} \times R_{k, k+1} \times \cdots \times R_{k, N}}$.
FCTN-ranks: the vector (length: $N(N-1) / 2$ ) collected by $R_{k_{1}, k_{2}}\left(1 \leq k_{1}<k_{2} \leq\right.$ $N$ and $\left.k_{1}, k_{2} \in \mathbb{N}^{+}\right)$.

## FCTN Decomposition

Higher-Order Tensors
? ? ?

Theorem 1 (Transpositional Invariance)
Supposing that an Nth-order tensor $\mathcal{X}$ has the following FCTN decomposition: $\mathcal{X}=$ $\operatorname{FCTN}\left(\mathcal{G}_{1}, \mathcal{G}_{2}, \cdots, \mathcal{G}_{N}\right)$. Then, its vector n-based generalized tensor transposition $\overrightarrow{\mathcal{X}^{\mathbf{n}}}$ can be expressed as $\overrightarrow{\mathcal{X}^{\mathbf{n}}}=\operatorname{FCTN}\left(\overrightarrow{\mathcal{G}}_{n_{1}}^{\mathrm{n}}, \overrightarrow{\mathcal{G}}_{n_{2}}^{\mathrm{n}}, \cdots, \overrightarrow{\mathcal{G}}_{n_{N}}^{\mathrm{n}}\right)$, where $\mathbf{n}=\left(n_{1}, n_{2}, \cdots, n_{N}\right)$ is a reordering of the vector $(1,2, \cdots, N)$.

Note: $\overrightarrow{\mathcal{X}^{\mathbf{n}}} \in \mathbb{R}^{I_{n_{1}} \times I_{n_{2}} \times \cdots \times I_{n_{N}}}$ is generated by rearranging the modes of $\mathcal{X}$ in the order specified by the vector $\mathbf{n}$.

FCTN Decomposition: has transpositional invariance.

## FCTN Decomposition

## Theorem 2 (The FCTN Rank and the Unfolding Matrix Rank)

Supposing that an Nth-order tensor $\mathcal{X}$ can be represented by Equation (1), the following inequality holds:

$$
\operatorname{Rank}\left(\mathbf{X}_{\left[n_{1: d} ; n_{d+1: N}\right]}\right) \leq \prod_{i=1}^{d} \prod_{j=d+1}^{N} R_{n_{i}, n_{j}},
$$

where $R_{n_{i}, n_{j}}=R_{n_{j}, n_{i}}$ if $n_{i}>n_{j}$ and $\left(n_{1}, n_{2}, \cdots, n_{N}\right)$ is a reordering of the vector $(1,2, \cdots, N)$.
Note: $\mathbf{X}_{\left[n_{1: d} ; n_{d+1: N}\right]}=\operatorname{reshape}\left(\overrightarrow{\mathcal{X}}, \prod_{i=1}^{d} I_{n_{i}}, \prod_{i=d+1}^{N} I_{n_{i}}\right)$.
Comparison:
$\triangleright$ TT-rank: $\operatorname{Rank}\left(\mathbf{X}_{[1: d ; d+1: N]}\right) \leq R_{d}$;
$\triangleright$ TR-rank: $\operatorname{Rank}\left(\mathbf{X}_{[1: d ; d+1: N]}\right) \leq R_{d} R_{N}$;
$\triangleright$ FCTN-rank: $\operatorname{Rank}\left(\mathbf{X}_{[1: d ; d+1: N]}\right) \leq \prod_{i=1}^{d} \prod_{j=d+1}^{N} R_{i, j}$.

## FCTN Decomposition

## Theorem 2 (The FCTN Rank and the Unfolding Matrix Rank)

Supposing that an Nth-order tensor $\mathcal{X}$ can be represented by Equation (1), the following inequality holds:

$$
\operatorname{Rank}\left(\mathbf{X}_{\left[n_{1: d} ; n_{d+1: N}\right]}\right) \leq \prod_{i=1}^{d} \prod_{j=d+1}^{N} R_{n_{i}, n_{j}}
$$

where $R_{n_{i}, n_{j}}=R_{n_{j}, n_{i}}$ if $n_{i}>n_{j}$ and $\left(n_{1}, n_{2}, \cdots, n_{N}\right)$ is a reordering of the vector $(1,2, \cdots, N)$.
Note: $\mathbf{X}_{\left[n_{1: d} ; n_{d+1: N}\right]}=\operatorname{reshape}\left(\overrightarrow{\mathcal{X}}{ }^{\mathbf{n}}, \prod_{i=1}^{d} I_{n_{i}}, \prod_{i=d+1}^{N} I_{n_{i}}\right)$.
Comparison:
$\triangleright$ TT-rank: $\operatorname{Rank}\left(\mathbf{X}_{[1: d ; d+1: N]}\right) \leq R_{d}$;
$\triangleright$ TR-rank: $\operatorname{Rank}\left(\mathbf{X}_{[1: d ; d+1: N]}\right) \leq R_{d} R_{N}$;
$\triangleright$ FCTN-rank: $\operatorname{Rank}\left(\mathbf{X}_{[1: d ; d+1: N]}\right) \leq \prod_{i=1}^{d} \prod_{j=d+1}^{N} R_{i, j}$.

- the FCTN-rank can bound the rank of all generalized tensor unfolding;
- can capture more informations than TT-rank and TR-rank;

## A Discussion of the Storage Cost

CP Decomposition
$\mathcal{O}\left(N R_{1} I\right)$

Tucker Decomposition
$\mathcal{O}\left(\mathrm{NIR}_{3}+R_{3}^{N}\right)$

TT/TR Decomposition $\mathcal{O}\left(N R_{2}^{2} I\right)$

FCTN Decomposition
$\mathcal{O}\left(N R_{4}^{N-1} I\right)$

## A Discussion of the Storage Cost

CP Decomposition $\mathcal{O}\left(N R_{1} I\right)$

Tucker Decomposition

$$
\mathcal{O}\left(N I R_{3}+R_{3}^{N}\right)
$$

TT/TR Decomposition
$\mathcal{O}\left(N R_{2}^{2} I\right)$

FCTN Decomposition
$\mathcal{O}\left(N R_{4}^{N-1} I\right)$

The storage cost of the FCTN decomposition seems to theoretical high. But when we express real-world data, the required FCTN-rank is usually less than CP, TT, TR, and Tucker-ranks.

## FCTN Composition

## Definition 2 (FCTN Composition)

We call the process of generating $\mathcal{X}$ by its FCTN factors $\mathcal{G}_{k}(k=1,2, \cdots N)$ as the FCTN composition, which is also denoted as $\operatorname{FCTN}\left(\left\{\mathcal{G}_{k}\right\}_{k=1}^{N}\right)$. If one of the factors $\mathcal{G}_{t}(t \in\{1,2, \cdots, N\})$ does not participate in the composition, we denote it as $\operatorname{FCTN}\left(\left\{\mathcal{G}_{k}\right\}_{k=1}^{N}, / \mathcal{G}_{t}\right)$

## Theorem 3

Supposing that $\mathcal{X}=\operatorname{FCTN}\left(\left\{\mathcal{G}_{k}\right\}_{k=1}^{N}\right)$ and $\mathcal{M}_{t}=\operatorname{FCTN}\left(\left\{\mathcal{G}_{k}\right\}_{k=1}^{N}, / \mathcal{G}_{t}\right)$, we obtain that

$$
\mathbf{X}_{(t)}=\left(\mathbf{G}_{t}\right)_{(t)}\left(\mathbf{M}_{t}\right)_{\left[m_{1: N-1 ;} ; n_{1: N-1}\right]},
$$

where

$$
m_{i}=\left\{\begin{array}{ll}
2 i, & \text { if } i<t, \\
2 i-1, & \text { if } i \geq t,
\end{array} \text { and } n_{i}= \begin{cases}2 i-1, & \text { if } i<t, \\
2 i, & \text { if } i \geq t .\end{cases}\right.
$$

& \mathcal{X} \in \mathbb{R}^{I_{1} \times I_{2} \times \cdots \times I_{N}}
\end{aligned}
$$

## FCTN-TC Model

$\Downarrow$

## FCTN Decomposition-Based TC (FCTN-TC) Model

$$
\begin{equation*}
\min _{\mathcal{X}, \mathcal{G}} \frac{1}{2}\left\|\mathcal{X}-\operatorname{FCTN}\left(\mathcal{G}_{1}, \mathcal{G}_{2}, \cdots, \mathcal{G}_{N}\right)\right\|_{F}^{2}+\iota_{\mathbb{S}}(\mathcal{X}) \tag{2}
\end{equation*}
$$

where $\mathcal{G}=\left(\mathcal{G}_{1}, \mathcal{G}_{2}, \cdots, \mathcal{G}_{N}\right)$,

$$
\iota_{\mathbb{S}}(\mathcal{X}):=\left\{\begin{array}{l}
0, \text { if } \mathcal{X} \in \mathbb{S}, \\
\infty, \text { otherwise },
\end{array} \text { with } \mathbb{S}:=\left\{\mathcal{X}: \mathcal{P}_{\Omega}(\mathcal{X}-\mathcal{F})=0\right\}\right.
$$

$\Omega$ is the index of the known elements, and $\mathcal{P}_{\Omega}(\mathcal{X})$ is a projection operator which projects the elements in $\Omega$ to themselves and all others to zeros.

## PAM-Based Algorithm

## Proximal Alternating Minimization (PAM)

$$
\left\{\begin{array}{l}
\mathcal{G}_{k}^{(s+1)}=\underset{\mathcal{G}_{k}}{\operatorname{argmin}}\left\{f\left(\mathcal{G}_{1: k-1}^{(s+1)}, \mathcal{G}_{k}, \mathcal{G}_{k+1: N}^{(s)}, \mathcal{X}^{(s)}\right)+\frac{\rho}{2}\left\|\mathcal{G}_{k}-\mathcal{G}_{k}^{(s)}\right\|_{F}^{2}\right\}, k=1,2, \cdots, N  \tag{3}\\
\mathcal{X}^{(s+1)}=\underset{\mathcal{X}}{\operatorname{argmin}}\left\{f\left(\mathcal{G}^{(s+1)}, \mathcal{X}\right)+\frac{\rho}{2}\left\|\mathcal{X}-\mathcal{X}^{(s)}\right\|_{F}^{2}\right\}
\end{array}\right.
$$

where $f(\mathcal{G}, \mathcal{X})$ is the objective function of (2) and $\rho>0$ is a proximal parameter.

## PAM-Based Algorithm

## Proximal Alternating Minimization (PAM)

$$
\left\{\begin{array}{l}
\mathcal{G}_{k}^{(s+1)}=\underset{\mathcal{G}_{k}}{\operatorname{argmin}}\left\{f\left(\mathcal{G}_{1: k-1}^{(s+1)}, \mathcal{G}_{k}, \mathcal{G}_{k+1: N}^{(s)}, \mathcal{X}^{(s)}\right)+\frac{\rho}{2}\left\|\mathcal{G}_{k}-\mathcal{G}_{k}^{(s)}\right\|_{F}^{2}\right\}, k=1,2, \cdots, N,  \tag{3}\\
\mathcal{X}^{(s+1)}=\underset{\mathcal{X}}{\operatorname{argmin}}\left\{f\left(\mathcal{G}^{(s+1)}, \mathcal{X}\right)+\frac{\rho}{2}\left\|\mathcal{X}-\mathcal{X}^{(s)}\right\|_{F}^{2}\right\},
\end{array}\right.
$$

where $f(\mathcal{G}, \mathcal{X})$ is the objective function of (2) and $\rho>0$ is a proximal parameter.
$\mathcal{G}_{k}$-Subproblems $(k=1,2, \cdots, N)$

$$
\begin{align*}
& \left(\mathbf{G}_{k}^{(s+1)}\right)_{(k)}=\left[\mathbf{X}_{(k)}^{(s)}\left(\mathbf{M}_{k}^{(s)}\right)_{\left[n_{1: N-1} ; m_{1: N-1}\right]}+\rho\left(\mathbf{G}_{k}^{(s)}\right)_{(k)}\right]\left[\left(\mathbf{M}_{k}^{(s)}\right)_{\left[m_{1: N-1} ; n_{1: N-1}\right]}\left(\mathbf{M}_{k}^{(s)}\right)_{\left[n_{1: N-1} ; m_{1: N-1}\right]}+\rho \mathbf{I}\right]^{-1},  \tag{4}\\
& \mathcal{G}_{k}^{(s+1)}=\operatorname{GenFold}\left(\left(\mathbf{G}_{k}^{(s+1)}\right)_{(k)}, k ; 1, \cdots, k-1, k+1, \cdots, N\right),
\end{align*}
$$ where $\mathcal{M}_{k}^{(s)}=\operatorname{FCTN}\left(\mathcal{G}_{1: k-1}^{(s+1)}, \mathcal{G}_{k}, \mathcal{G}_{k+1: N}^{(s)}, / \mathcal{G}_{k}\right)$, and vectors $\mathbf{m}$ and $\mathbf{n}$ have the same setting as that in Theorem 3.

$\mathcal{X}$-Subproblem

$$
\begin{equation*}
\mathcal{X}^{(s+1)}=\mathcal{P}_{\Omega^{c}}\left(\frac{\operatorname{FCTN}\left(\left\{\mathcal{G}_{k}^{(s+1)}\right\}_{k=1}^{N}\right)+\rho \mathcal{X}^{(s)}}{1+\rho}\right)+\mathcal{P}_{\Omega}(\mathcal{F}) \tag{5}
\end{equation*}
$$

## PAM-Based Algorithm

## Algorithm 1 PAM-Based Solver for the FCTN-TC Model.

Input: $\mathcal{F} \in \mathbb{R}^{I_{1} \times I_{2} \times \cdots \times I_{N}}, \Omega$, the maximal FCTN-rank $R^{\max }$, and $\rho=0.1$.
Initialization: $s=0, s^{\max }=1000, \mathcal{X}^{(0)}=\mathcal{F}$, the initial FCTN-rank $R=\max \{\operatorname{ones}(N(N-$

1) $\left./ 2,1), R^{\text {max }}-5\right\}$, and $\mathcal{G}_{k}^{(0)}=\operatorname{rand}\left(R_{1, k}, R_{2, k}, \cdots, R_{k-1, k}, I_{k}, R_{k, k+1}, \cdots, R_{k, N}\right)$, where $k=1,2, \cdots, N$. while not converged and $s<s^{\max }$ do

Update $\mathcal{G}_{k}^{(s+1)}$ via (4).
Update $\mathcal{X}^{(s+1)}$ via (5).
Let $R=\min \left\{R+1, R^{\max }\right\}$ and expand $\mathcal{G}_{k}^{(s+1)}$ if $\left\|\mathcal{X}^{(s+1)}-\mathcal{X}^{(s)}\right\|_{F} /\left\|\mathcal{X}^{(s)}\right\|_{F}<10^{-2}$.
Check the convergence condition: $\left\|\mathcal{X}^{(s+1)}-\mathcal{X}^{(s)}\right\|_{F} /\left\|\mathcal{X}^{(s)}\right\|_{F}<10^{-5}$.
Let $s=s+1$.
end while
Output: The reconstructed tensor $\mathcal{X}$.

Theorem 4 (Convergence)
The sequence $\left\{\mathcal{G}^{(s)}, \mathcal{X}^{(s)}\right\}_{s \in \mathbb{N}}$ obtained by the Algorithm 1 globally converges to a critical point of (2).

Figure 4: Reconstructed results on the traffic flow dataset with $M R=40 \%$. The first and the second rows are the results on the 2nd day and the corresponding residual results, respectively.

The data is available at http://gtl.inrialpes.fr/.

## Conclusion

## Contributions

(1) Propose an FCTN decomposition, which breaks through the limitations of TT and TR decompositions;
(2) Employ the FCTN decomposition to the TC problem and develop an efficient PAMbased algorithm to solve it;
(3) Theoretically demonstrate the convergence of the developed algorithm.

## Conclusion

## Contributions

(1) Propose an FCTN decomposition, which breaks through the limitations of TT and TR decompositions;
(2) Employ the FCTN decomposition to the TC problem and develop an efficient PAMbased algorithm to solve it;
(3) Theoretically demonstrate the convergence of the developed algorithm.

## Challenges and Future Directions

(1) Difficulty in finding the optimal FCTN-ranks $\Leftarrow$ Exploit prior knowledge of factors;
(2) Storage cost seems to theoretical high $\Leftarrow$ Introduce probability graphical model.

## Thank you very much for listening!
